

IAN O'ROURKE

Technical Product Manager | Enterprise Data Products, API Platform & AI Delivery

ianmorourke@gmail.com | (301) 658-8431 | Alexandria, VA (NYC or remote) | iorourke.com | linkedin.com/in/ian-m-orourke

SUMMARY

Technical product manager with 12 years of experience in technology and 5+ in product, an engineering background (B.S. Computer Science Engineering; former Integration Engineer on the DevExchange APIs), and current AI delivery work in an AI Pod. Owns platform and API products close to the code: writes engineering-ready specifications, defines the technical KPIs that govern production, and works day to day with engineers. Led product on a 13M+ account financial ledger and pioneered a spec-driven development model in which AI-consumable specifications ship production code. Two patent applications that came out of direct customer discovery.

PROFESSIONAL EXPERIENCE

Capital One Aug 2019 – Present

Manager, Product Management, Card Technology Jan 2026 – Present

- Recoveries ran on a costly legacy platform with no path to modern capabilities. Delivered a credit balance refund capability spanning multiple Card systems, running discovery with business intent owners, translating requirements into technical specifications and making Recoveries the first Card workload running on the in-house modern core to de-risk other Card products.
- Development was a long pole to achieving rapid implementation of new products enabled by a modern financial core. Pioneered an AI-assisted intent pipeline that turns requirements documents into specifications ready for AI to generate production code. Accelerated time to develop, and established metrics for ensuring code was production ready.
- Deployments were infrequent and included major and minor updates, creating overhead and risk every cycle. Lead agile delivery across cross-functional engineering teams, shipping 2 major releases per quarter and enabling daily minor releases via CI/CD.

Manager, Product Management, Core Modernization Jan 2024 – Jan 2026

- Changes to the legacy mainframe took over a year and millions of dollars, delaying every new customer-facing capability and lagging the market. Worked with our financial services customers to gather requirements, then led design and launch of the digital-first ledger that replaced it. The data platform is now servicing 13M+ Auto accounts at sub-100ms, cutting release cycles from years to months, and anchoring the mainframe's retirement.
- Customers expect their financial information to be readily available. Gathered requirements from clients on SLAs. Refined and tracked technical KPIs (uptime, throughput, API success rate) governing the core, sustaining 99.99% uptime across 12 months in production.
- Novel capabilities were less understood by users of our platform. Ran product demos and technical reviews for customers, engineering teams and executive leadership, translating platform capabilities and migration risk into terms each audience could act on.

Senior Associate, Product Management, Core Modernization Jan 2021 – Jan 2024

- Development of a modern enterprise data platform was complex and challenging to envision. Authored 20+ technical PRDs, including novel capabilities like retroactive transaction application and automated balance recalculation, that turned complex business requirements into engineering-ready specs and drove 70+ platform features into production on schedule.
- Conducted discovery with small-business cardholders and their sub-users, uncovering a card-request workflow gap that led to two patent applications: a utility patent for an off-the-shelf temporary credit card, and a design patent for a pull-model card creation interface.

Integration Engineer Aug 2019 – Jan 2021

- Partners consistently stalled on the three-legged authorization code flow, where the customer's consent returns an authorization code that must be exchanged for an access token before any customer transaction data call succeeds. Built runnable Postman collections and sample applications covering the full handshake, improved the partner-facing integration docs, and demoed the flow live to partner engineering teams, getting partners through authentication faster and with fewer escalations.
- Integration engineers often worked on repetitive, manual tasks. Developed tools and scripts to use to automate them and created SOPs for these processes that enabled future integration engineers to onboard smoothly.

Fishbowl Marketing, LLC Aug 2014 – Aug 2019

Technical Consultant

- Consulted directly with restaurant clients to gather requirements and build data-driven marketing systems in JavaScript and SQL, automating behavioral targeting to a client's most engaged diners.

SKILLS

Product: technical spec and PRD authoring, technical discovery, cross-functional roadmap development, agile delivery, KPI definition, A/B testing & experimentation, product analytics

Technical: AI/ML delivery, SQL, Python, JavaScript, RESTful APIs, CI/CD, AI-assisted & spec-driven development

Domain: fintech, card issuing & transaction processing, financial ledgers

PROJECTS

- razorio.com** - AI-native business-idea evaluator, built and shipped solo. | **iorourke.com** - AI-generated interactive resume site.

EDUCATION

B.S., Computer Science Engineering - West Virginia University
